California Irrigation Management Information System

Station Logs

1

The site is in the agricultural research area of the CSU Fresno Campus. The station is located on a large section of grass maintained by university personnel.

2

The site is at the UC Westside Field Station research facility. Located on a large grass plot, it has few constraints.

3

The site is located on a small grassed area adjacent to river. The station is severely constrained by its location and the surrounding landuse: to the Northeast is the small house approximately 50' away; a small utility shed and water tank is located to the East less than 50' away; a large bare packed soil equipment storage yard lies to the South (immediately adjacent to the station location are pallets of boxes for use in packing vegetables in the field--extends approximately 15' high) for approximately 60-70' then the river levee rises to about 20'; a row crop field extends to the West.

4

The site is located in an intermittantly sprinkler irrigated pasture on the side of a hill. It has few constraints: to the Northwest the terrain slopes downward to the main drainage feature approximately 100'+ then a line of tall eucalyptus trees; to the East lies an avocado orchard 70-80' away; South and West is grass on a gentle slope.

A board along the top of the station enclosure affects Net Radiation data for one hour in the morning or afternoon (depending on the season) due to shading of the sensor. Water from the sprinkler irrigation system is collected in the raingage and is recorded as precipitation.

5

The station is located at the USDA Cotton Research Station north of Shafter. The area is predominantly row crop land with scattered distant almond orchards in all directions. A grass plot about 120'(w-e) x 60'(n-s) is located in the cotton stations experimental crop growing area. The weather station is located about 65' east and 20' north of the southwest corner of the grass plot. Most years cotton is grown around the grass plot, although small grains are used in rotation. A dirt road borders western edge of the grass.

The grass is flood irrigated and the vigorously growing perenial rye grass is regularly cut. There is no more than 70' of upwind grass fetch in the northwesterly prevailing wind direction. A 4' high chain link fence surrounds the station which also includes a USWB Class A evaporation pan. The USDA owned station uses a pyrenometer and net radiometer which are different from the CIMIS

Department of Water Resources

Station Logs

standard equipment.

6

The site is located on large grassed tract adjacent to experimental plots at UC Davis. There are few constraints: 60-70' to East lies a dirt access road then intermittent row crops; small buildings with 20' concrete irrigation risers are adjacent to road.

Water from the hand-mode sprinkler system can be collected in the raingage and recorded as precipitation.
